WireBox's inspiration has been based on the idea of rapid workflows when building object oriented ColdFusion (CFML) applications, programmatic configurations and simplicity.

With that motivation we introduced dependency injection by annotations and conventions, which has been the core foundation of WireBox.

ColdBox is a conventions-based MVC development framework for ColdFusion (CFML). It provides a set of reusable code and tools that can be used to increase your development productivity as well as a development standard for working in team environments.
